Analysis

Hello! Ever wondered what might happen if you invested in a stock? Since nobody has a crystal ball, we use 'Monte Carlo simulations' to make educated guesses about potential investment outcomes. This simulation ran 1,000 'what if' scenarios for a \$1,000 investment in Apple (AAPL) stock over one year, based on its past behavior.

Summary of Likely Outcomes

The simulation estimated a 76.9% chance of making money and a 23.1% chance of losing money on your \$1,000 investment over a year. The 'median' outcome (the middle result if all possibilities were lined up) suggested a profit of \$242.46, or your \$1,000 growing to \$1,242.46. The average expected profit was \$286.78.

Looking at the range, in 5% of scenarios, the stock's end price could be worse than \$243.00 per share; in another 5%, it could be better than \$615.43. A key risk measure, 'VaR (Value at Risk)', suggests you would lose more than \$218.51 only 5% of the time. This means in 95 out of 100 scenarios, your loss would be less than or equal to that, or you'd make money. For the worst 5% scenarios, 'CVaR (Conditional Value at Risk)' indicates the average loss would be \$306.82. The best cases simulated showed a profit of \$1,416.64.

Key Risks:

- Chance of Loss: There's about a 23.1% chance of losing money.
- Potential for Downturns: In 5% of scenarios, losses could exceed \$218.51, with average losses of \$306.82 in those worst cases.
- Volatility: Apple stock has a 'historical annual volatility' of 27.98%, meaning its price tends to swing significantly (up and down), making it a potentially bumpy ride.

Key Upsides:

- High Probability of Profit: A 76.9% chance of making money is favorable.
- Good Potential Returns: Average expected profit of \$286.78, with a best-case profit of \$1,416.64.

What This Suggests

This simulation suggests that a \$1,000 investment in Apple stock for a year *could* be rewarding, with a higher likelihood of profit than loss. However, be comfortable with price swings and potential losses. Balance potential gains with a realistic understanding of risk.
